

****Hyperdiluted Radiesse Pre-Treatment:****

Hyperdiluted Radiesse is a dermal filler treatment designed to stimulate collagen production and improve skin texture, elasticity, and firmness. Before treatment, the provider will conduct a thorough consultation to assess your skin and discuss your goals. The Radiesse filler is diluted with saline or lidocaine to create a smoother, more spreadable solution for overall skin rejuvenation. The areas typically treated include the neck, décolletage, and arms. Patients should avoid alcohol, aspirin, and other blood-thinning agents at least 24 hours before the procedure to minimize bruising or swelling.

****Hyperdiluted Radiesse Post-Treatment:****

After the procedure, you may experience mild redness, swelling, or bruising in the treated areas, which usually resolves within a few days. It's important to avoid strenuous activities, saunas, and direct sun exposure for at least 24-48 hours. Over the next few weeks, Radiesse will stimulate collagen production, leading to gradual improvements in skin firmness and texture. Optimal results are typically seen in 4-6 weeks, with effects lasting up to a year or longer, depending on individual skin conditions. Follow-up treatments may be recommended for maintenance.
